

ABSTRACT OF THE DISCLOSURE

Absorbent articles and methods for use. The articles are used in the vestibule of a female wearer, and comprise a baffle, an absorbent, a retainer flap extending over the baffle, and optionally a liquid permeable cover. The absorbent article and retainer flap have first and second perimeters. A first portion of the second outer perimeter is positioned and attached proximate the first outer perimeter. The second portion of the second outer perimeter extends across an outer surface of the baffle. The first and second portions of the second perimeter can be sectioned. For disposal, the absorbent article is folded with first and second portions of the edge of the absorbent article in facing relationship. The retainer flap is folded over the edge portions to open the first cavity and define a second cavity receiving the facing portions.
